Solution to the exercise of the second session

1. Why is the output $30.00?

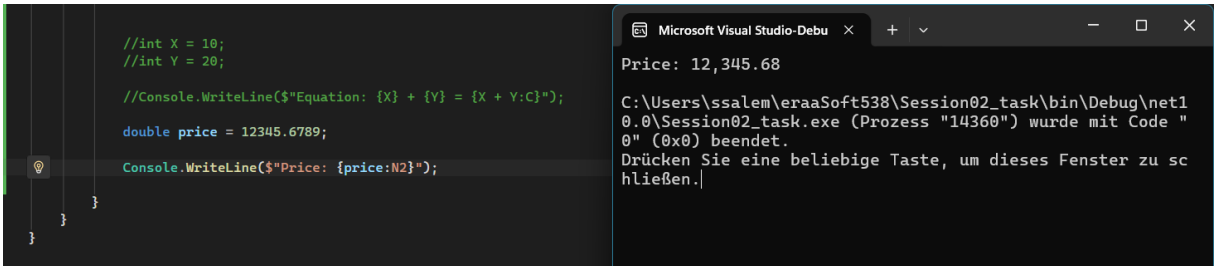

- X + Y = 10 + 20 = 30
- :C is the Currency format specifier in C#.
- It formats 30 as a currency value.
- Therefore, the output is $30.00.
- The .00 means that the value is displayed with two decimal places.

2. What is the benefit?

The: C format specifier is useful when displaying money values, such as prices, costs, or salaries.
It makes the output easier to understand because it clearly shows that the number represents a currency amount.

3. try another example with a different specifier with a screenshot of the output.

The **N2** format specifier displays the number with thousands of separators and two decimal places.

The: N specifier formats a number using number formatting, including thousands separators and decimal places.
